

SUNGUARD™

UV Stabilizer Masterbatch

What is UV Stabilizer Masterbatch?

UV Stabilizer Masterbatch is a compounded mixture of a UV stabilizer in a polymer base, along with special additives.

UV Stabilizers can be added to plastics to protect them from the degradative effects of exposure to sun and weather. Polyolefins are susceptible to attack by ultraviolet light, oxygen, moisture, and heat resulting in polymer brittleness, surface crazing, color change and product failure.

Why SUNGUARD™ UV Light Stabilizers?

Sunguard™ offers the highest retention levels among all UV MB suppliers. We use only the highest quality of HALS with no compromise in additive levels. We also add proprietary additives and antioxidants that enhance long-term stability and enhance the effect of HALS. The result - we offer the best retention levels in the industry at the same addition levels.

OUR PROMISE

FULL 20% ACTIVE CONTENT

We guarantee full 20% addition of HALS (active content) in order to allow highest retention in the industry. Even our additive content is deducted from base resin instead of active content.

PURE HALS BASED CHEMISTRY

We use only Swiss/German origin HALS instead of Chinese alternatives. We do not add any nickel quenchers or cheaper alternatives as replacements for HALS.

CONSISTENT QUALITY

We use state-of-the-art technologies such as split feeding and twin-screw compounding to ensure consistent quality in every batch.

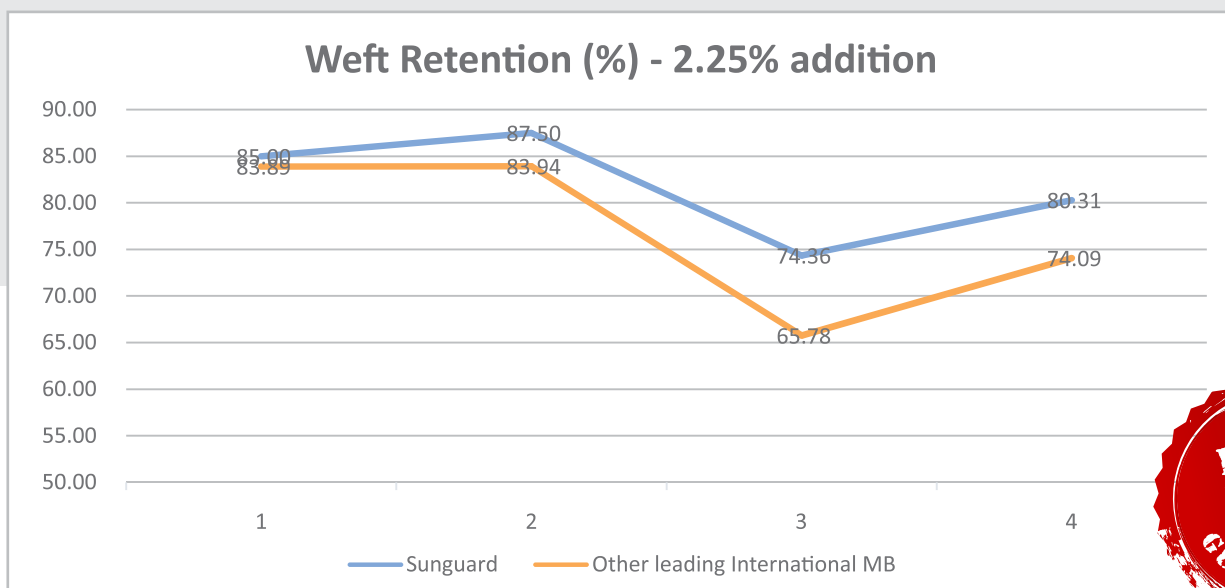

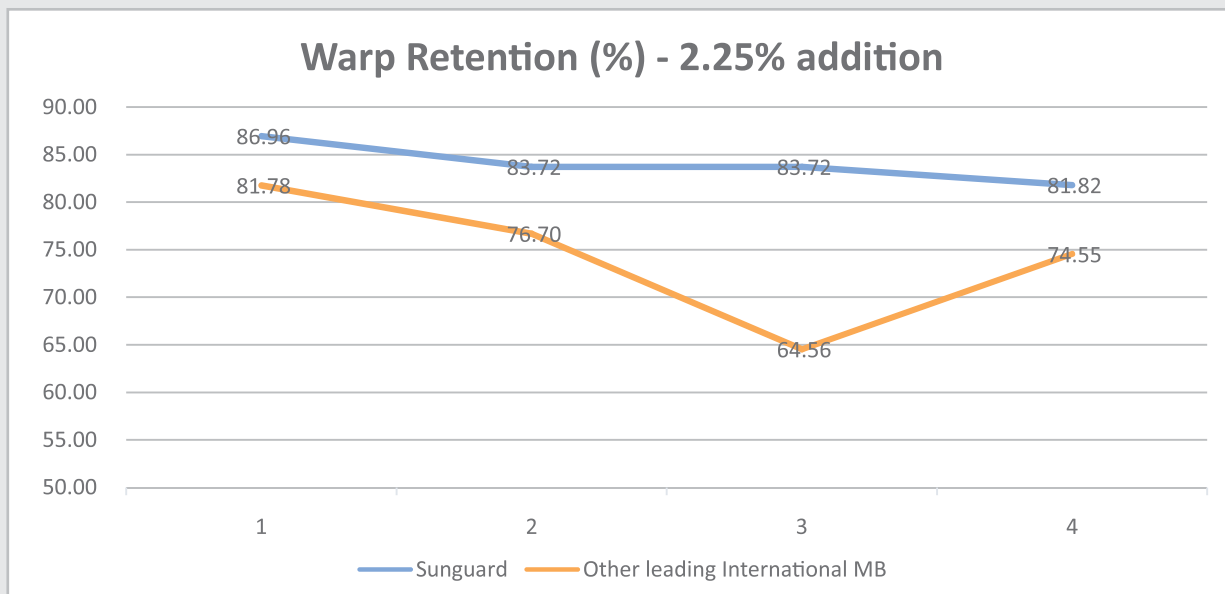

ZERO FILLER CONTENT

We do not add any calcium/ talc filler to our product for cost saving. This allows users to control final filler levels in their product accurately.

QUALITY THAT RESULTS IN SAVINGS

We offer the same retention @1.5% addition, compared with 2% addition of other leading masterbatches. Take a trial today and find out yourself!

Recommended Dosage : 1.25 - 2.5%
